

Constraining X-ray reflection in the LLAGN NGC 3718 with NuSTAR and XMM-Newton

Yaherlyn Díaz

Advisor: Patricia Arévalo and Lorena Hernández-García

Unified Model

From: Urry & Padovani, 1995

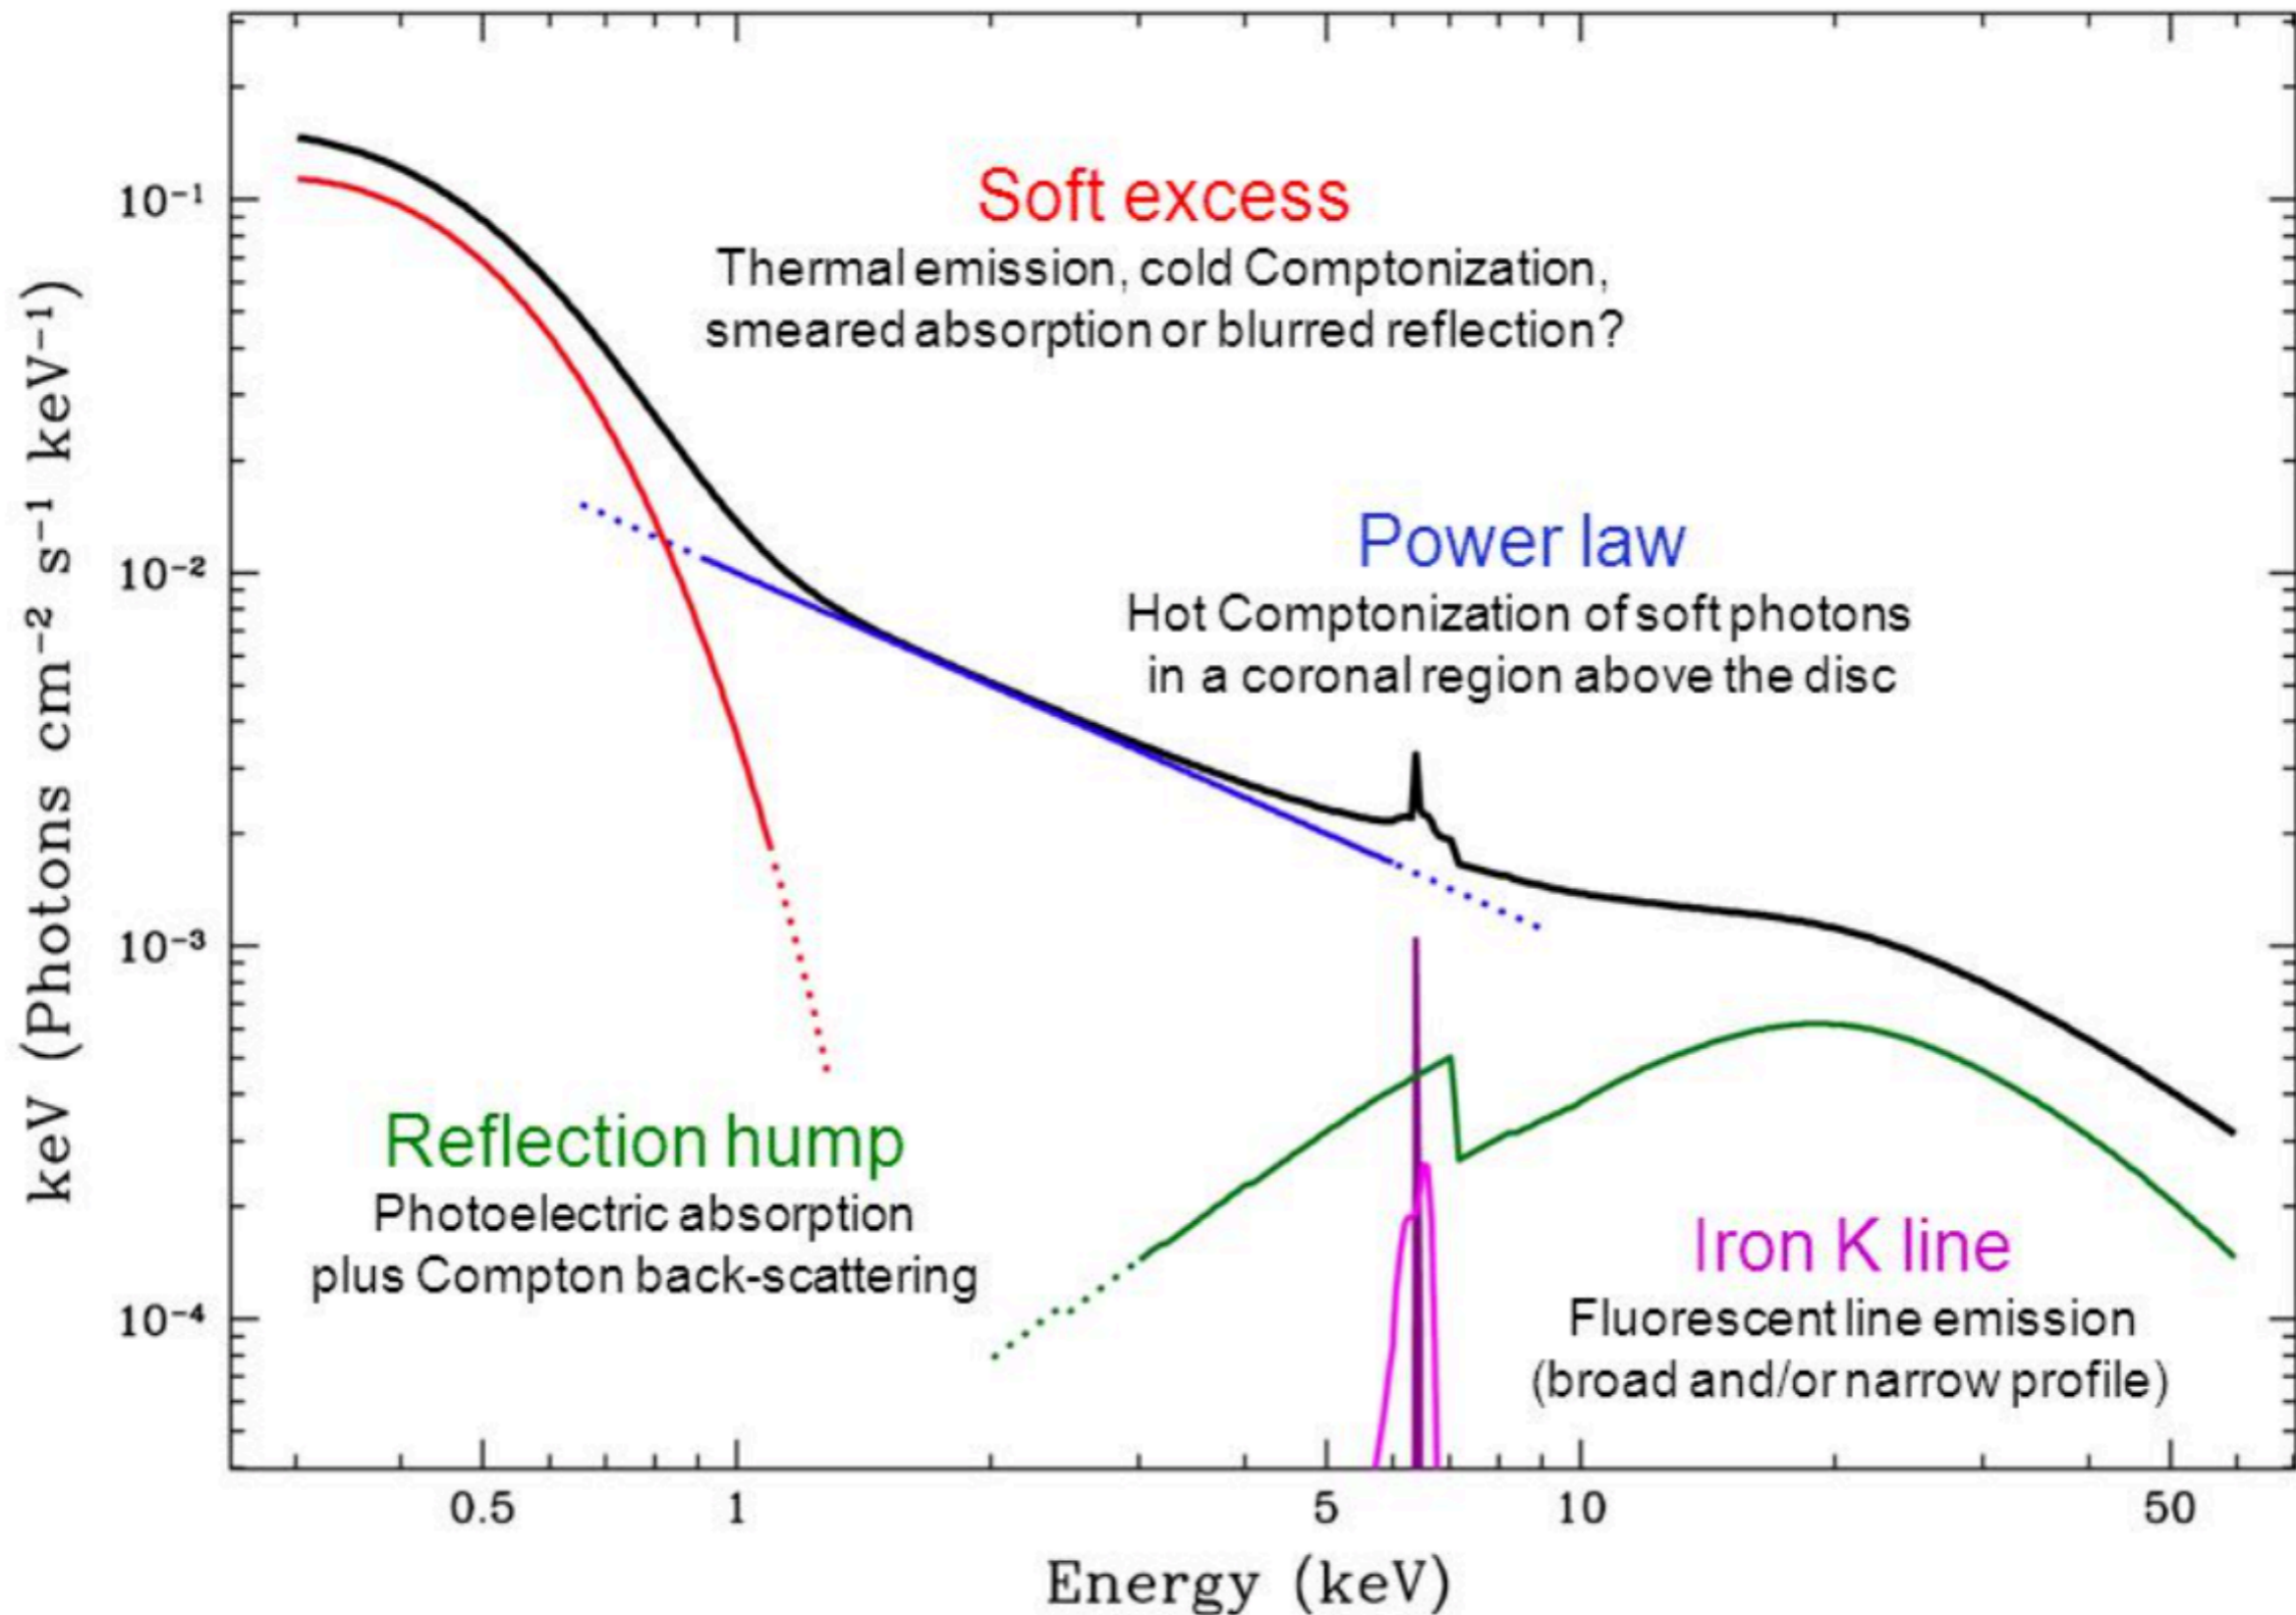

Obscuration is a function of the accretion rate!

This work

From: Ricci et al. 2017

AGN X-ray Spectral Energy Distribution

model X-ray spectrum

model X-ray spectrum

model X-ray spectrum

$N_H=10^{25}$, $C=0.25$

decreasing covering fraction

$N_H=10^{25}$, $C=0.05$

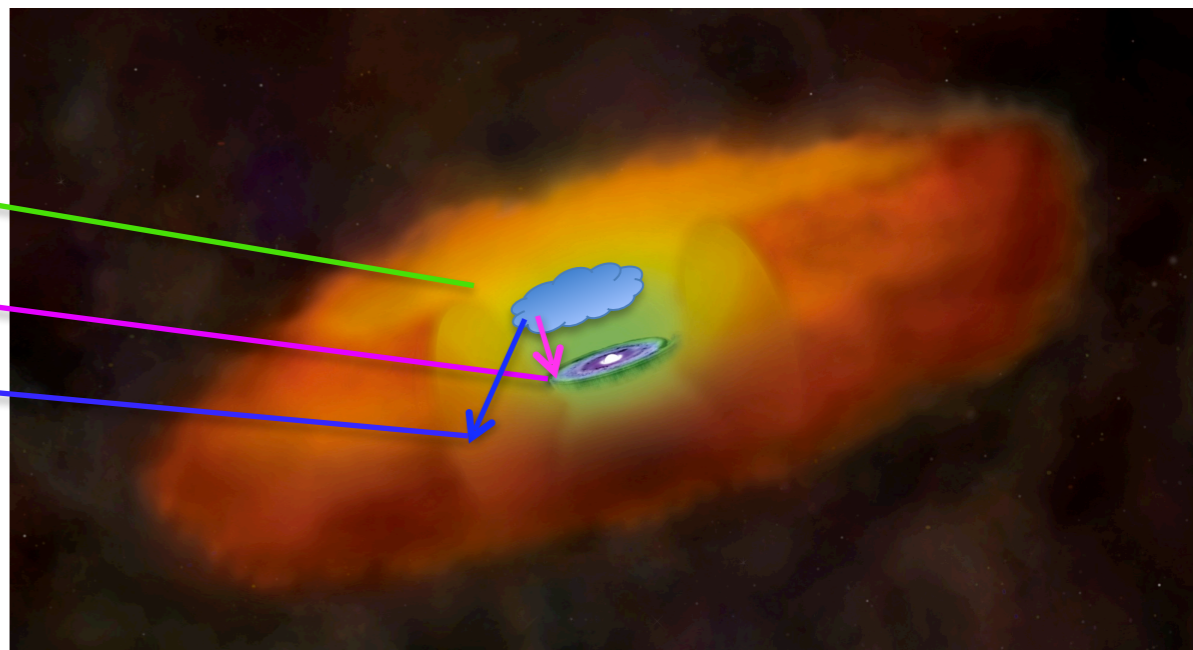

$N_H=10^{24}$, $C=0.5$

decreasing column density

$N_H=10^{23}$, $C=0.5$

model X-ray spectrum

model X-ray spectrum

Is the Spectral Index (Gamma) a function of the Eddington ratio in AGNs?

- For high Luminosity AGNs: Positively correlation
- For Low luminosity AGNs: Negative correlation

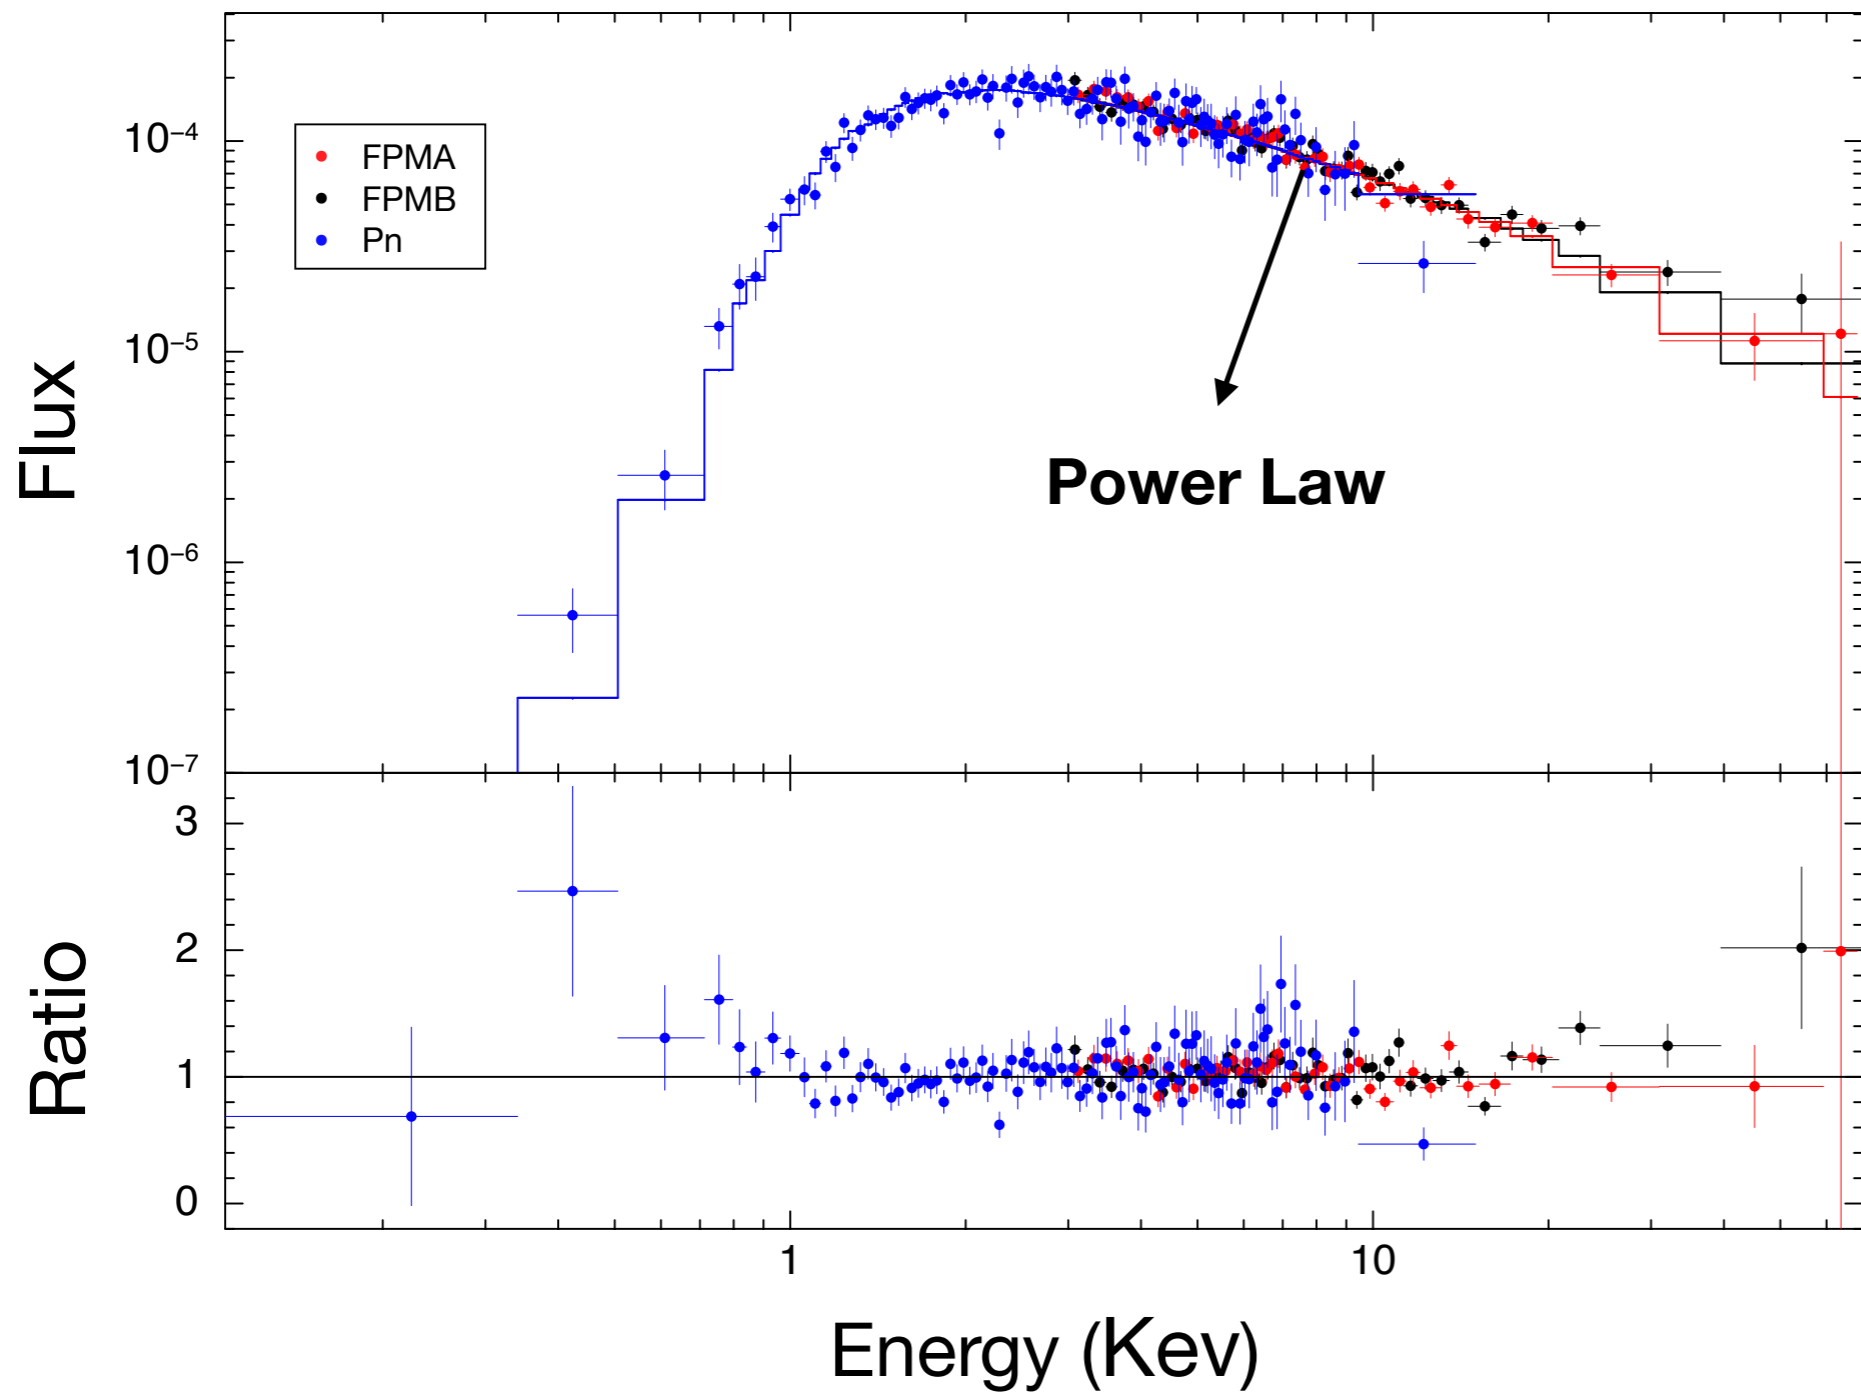

Change of the accretion physics

From: She et al. 2018

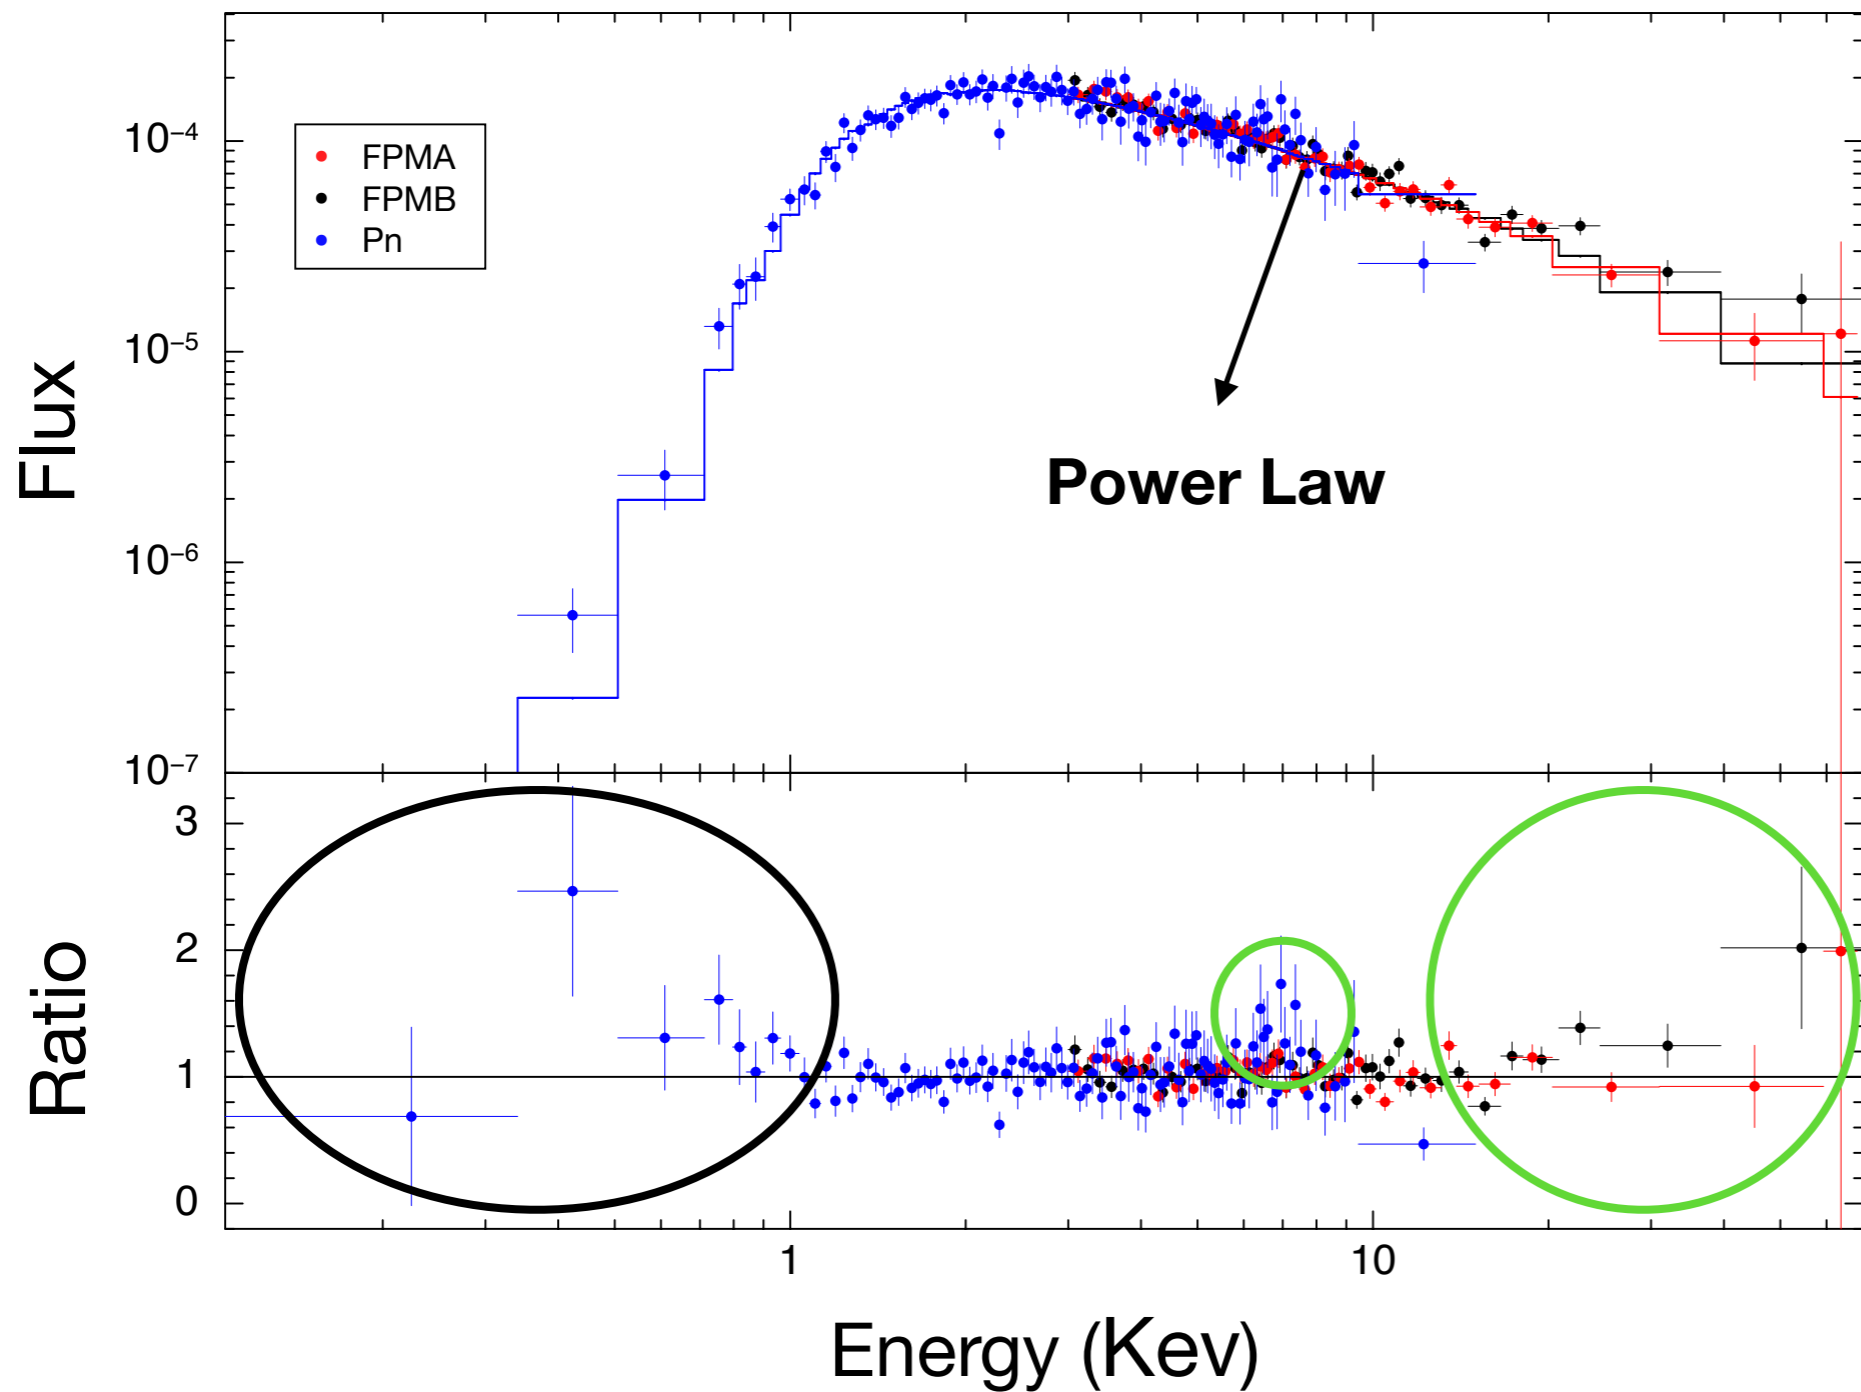

In this work...

Step 1: Spectrum of NGC3718

- Redshift 0.003
(L. Hernández-García et al. 2014)
- LINER 1.9 (optical classification)
(Ho et al. 1997)
- Low Accretion rate
 $L_{\text{Edd}}/L_{\text{Bol}} \sim 10^{-5}$
(L. Hernández-García et al. 2014)

Step 1: Spectrum of NGC3718

- Redshift 0.003
(L. Hernández-García et al. 2014)
- LINER 1.9 (optical classification)
(Ho et al. 1997)
- Low Accretion rate
 $L_{\text{Edd}}/L_{\text{Bol}} \sim 10^{-5}$
(L. Hernández-García et al. 2014)

A power law model fails

Hints of Reflection!

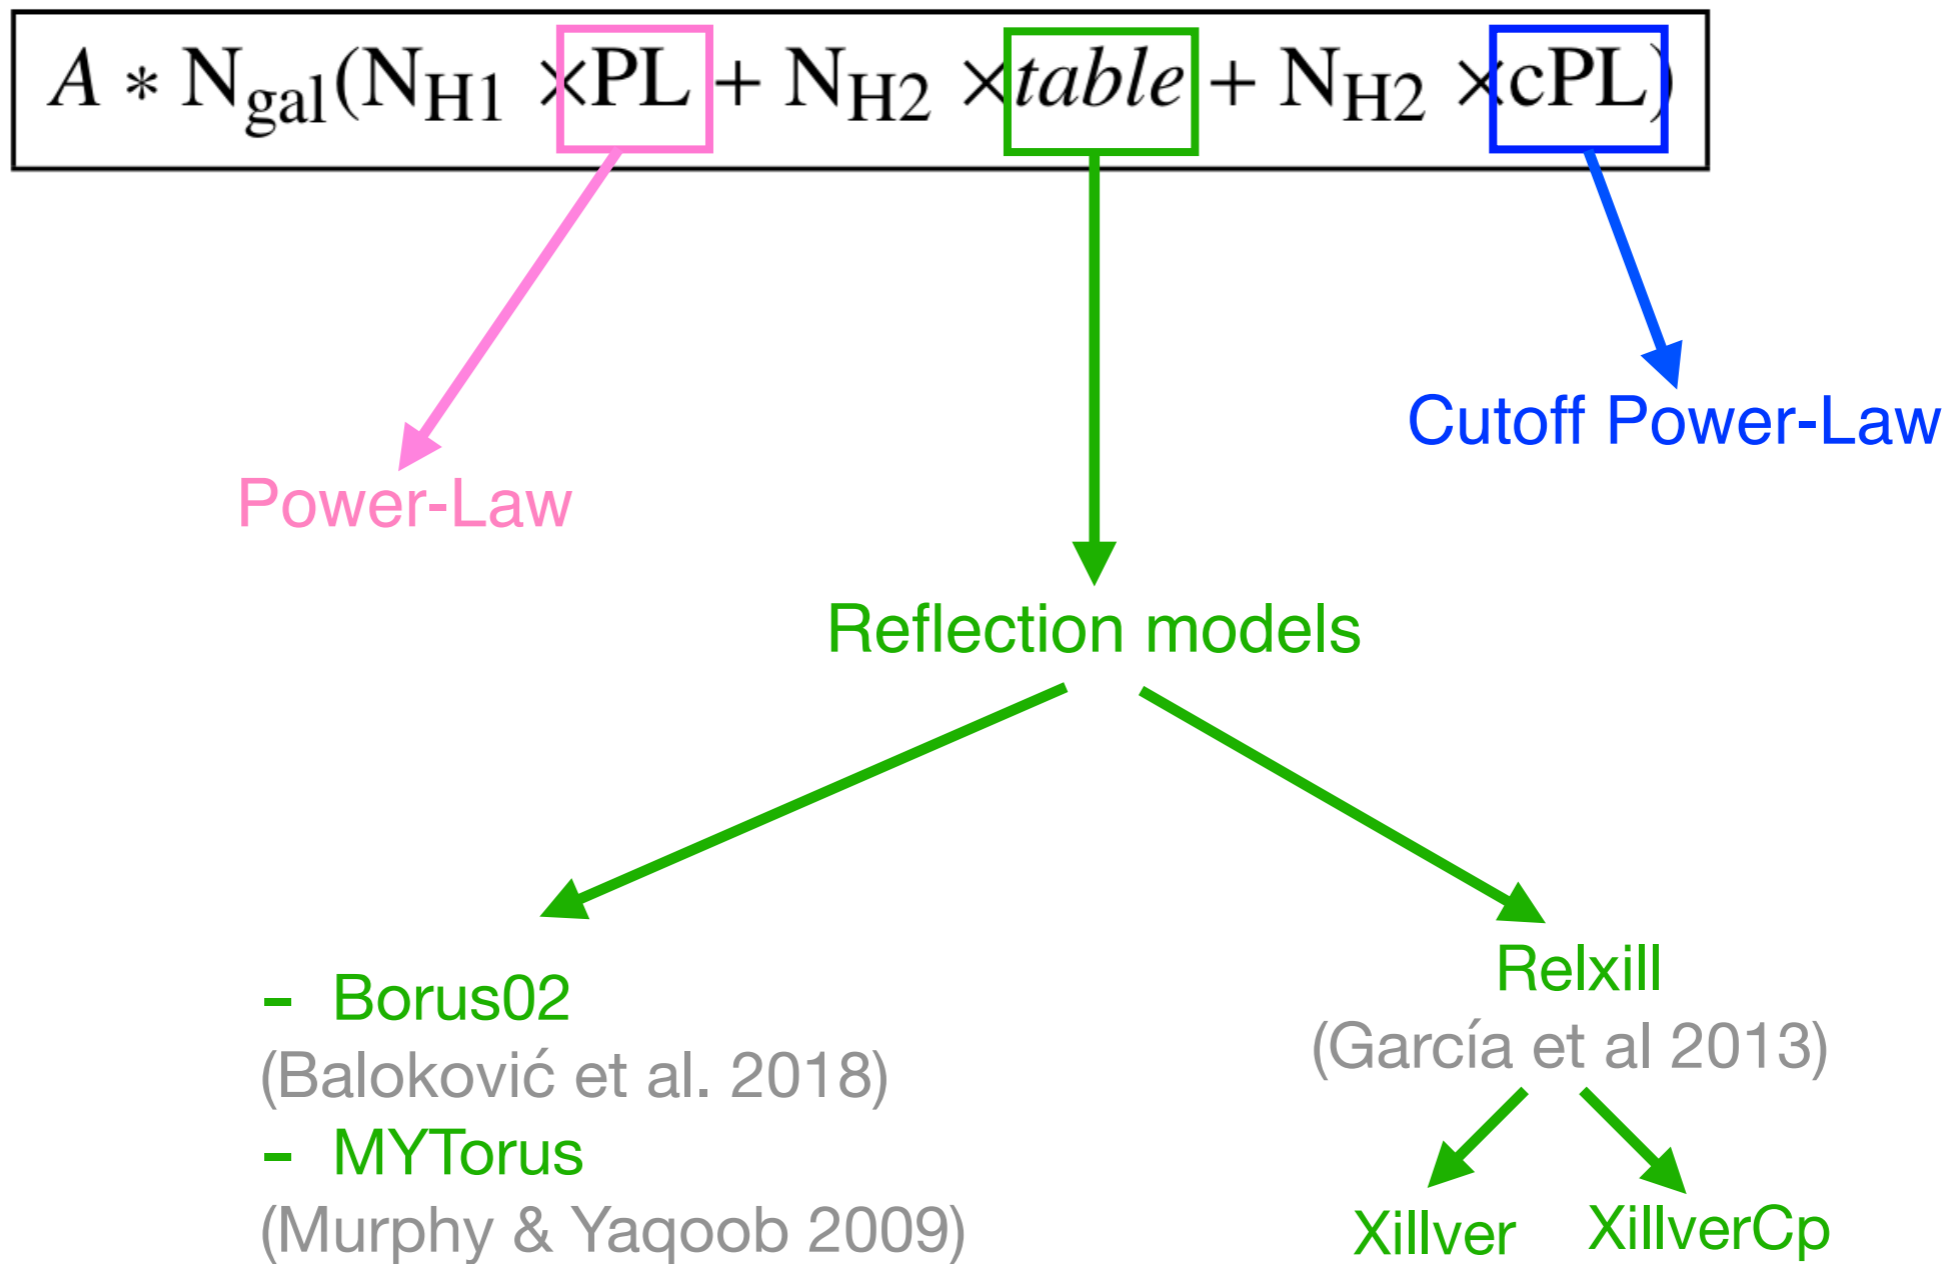

Our Model...

$$A * N_{gal} (N_{H1} \times PL + N_{H2} \times table + N_{H2} \times cPL)$$

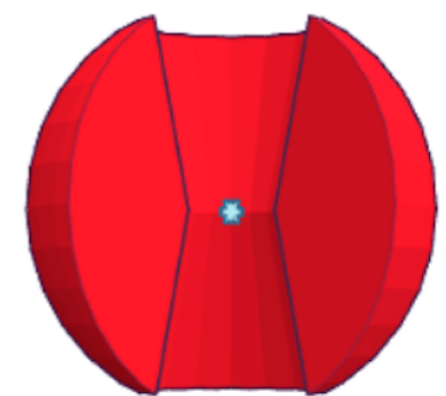

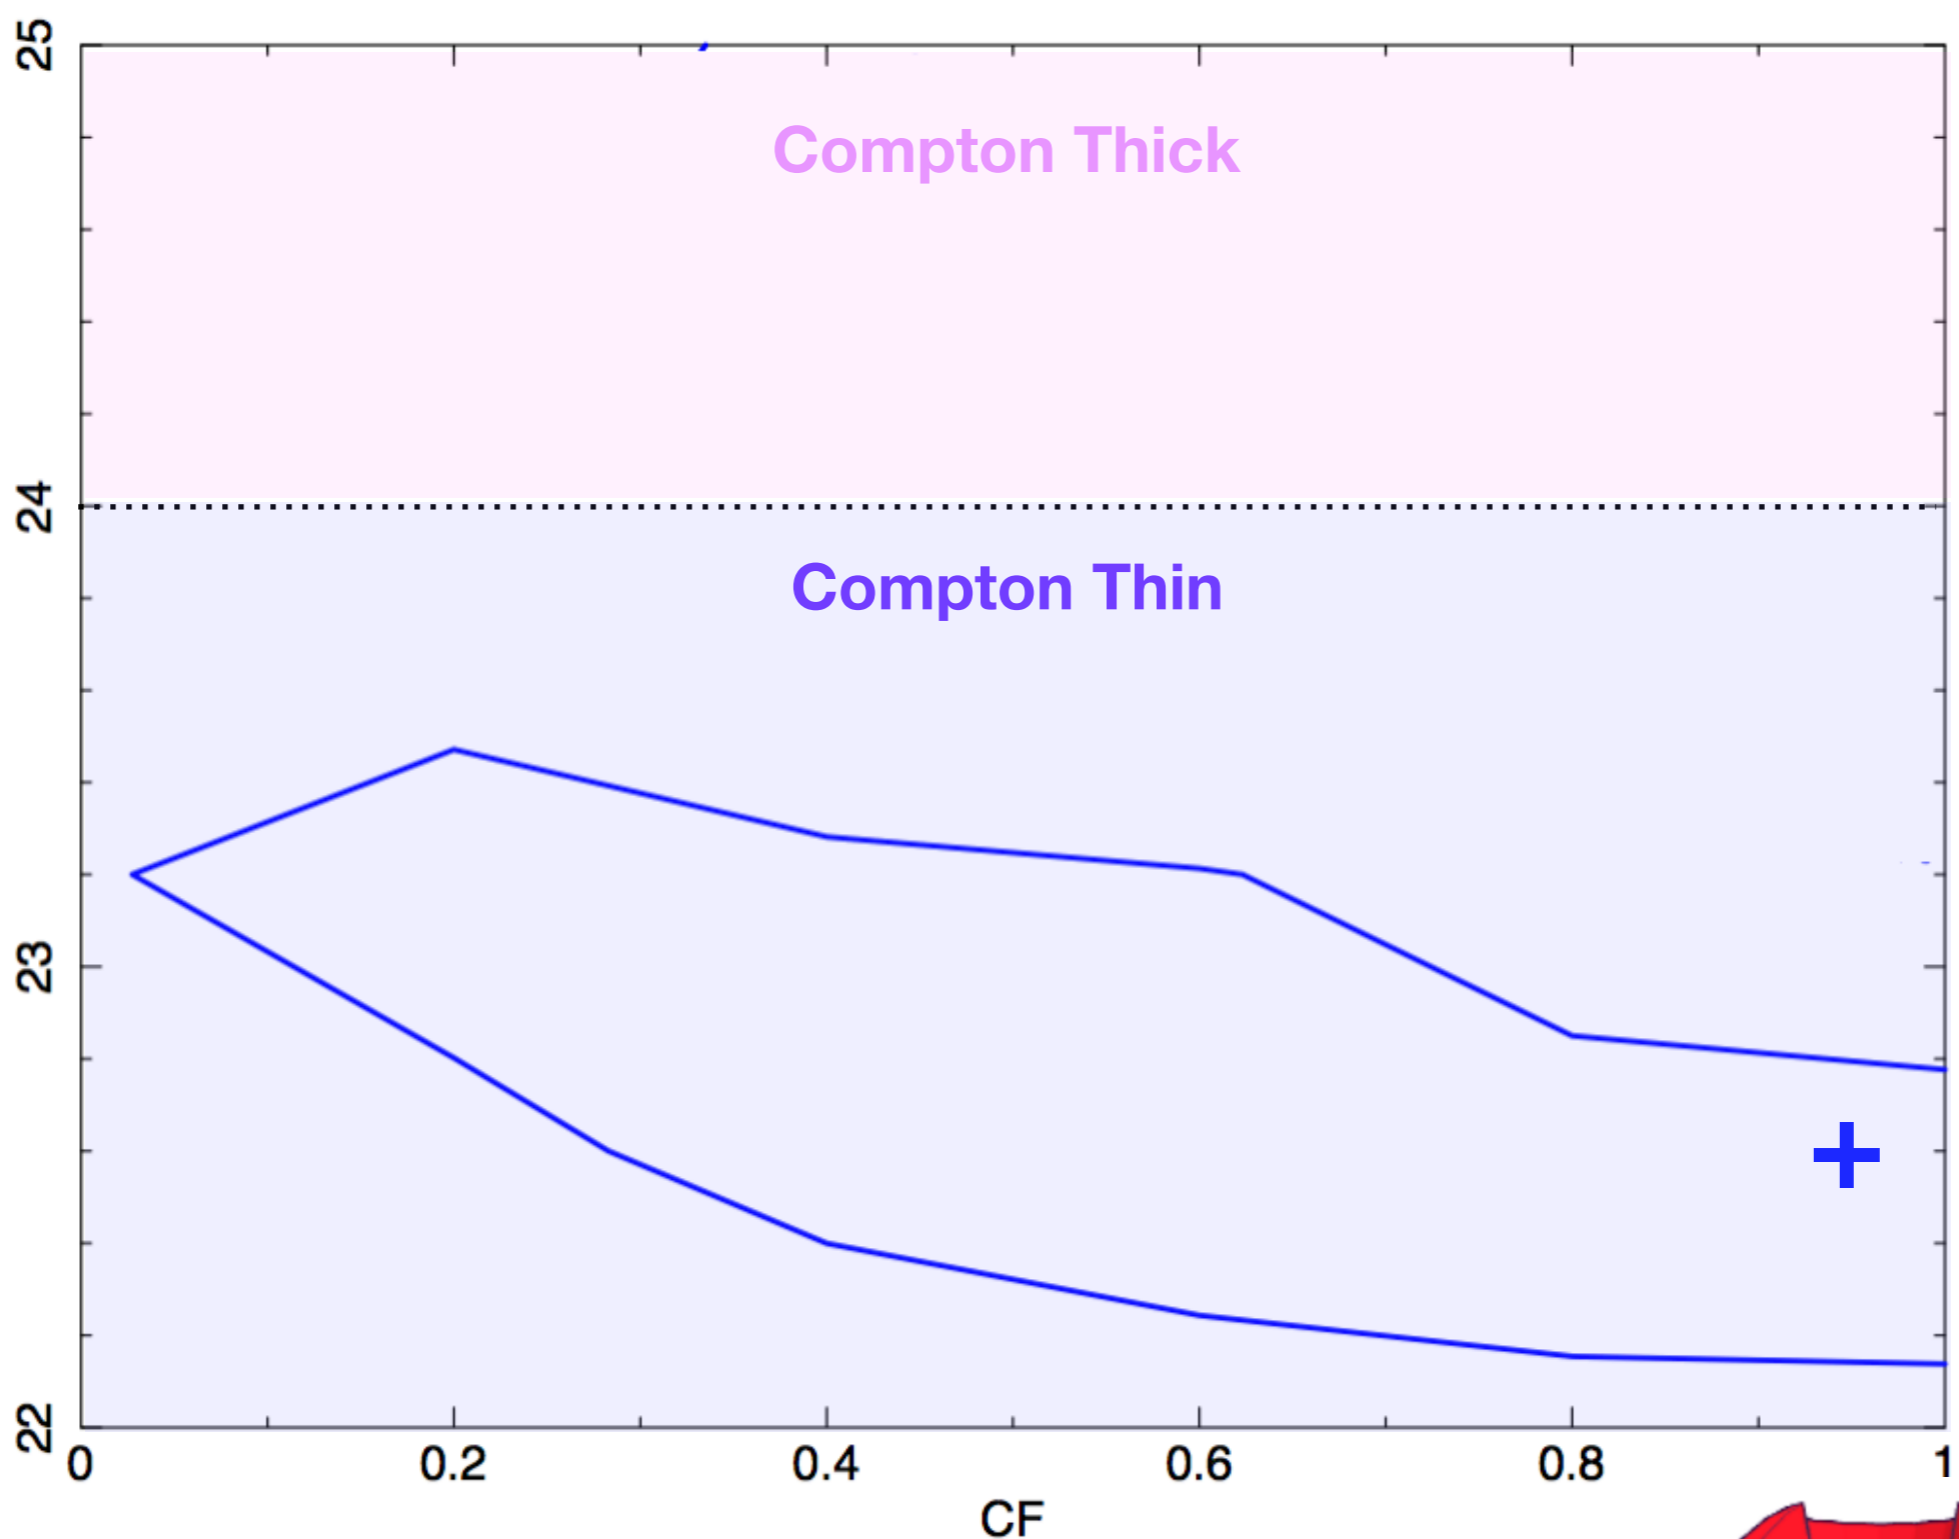

Column density of absorbing material acting on the scattered power-law

Column density acting on the nuclear components

Our Model...

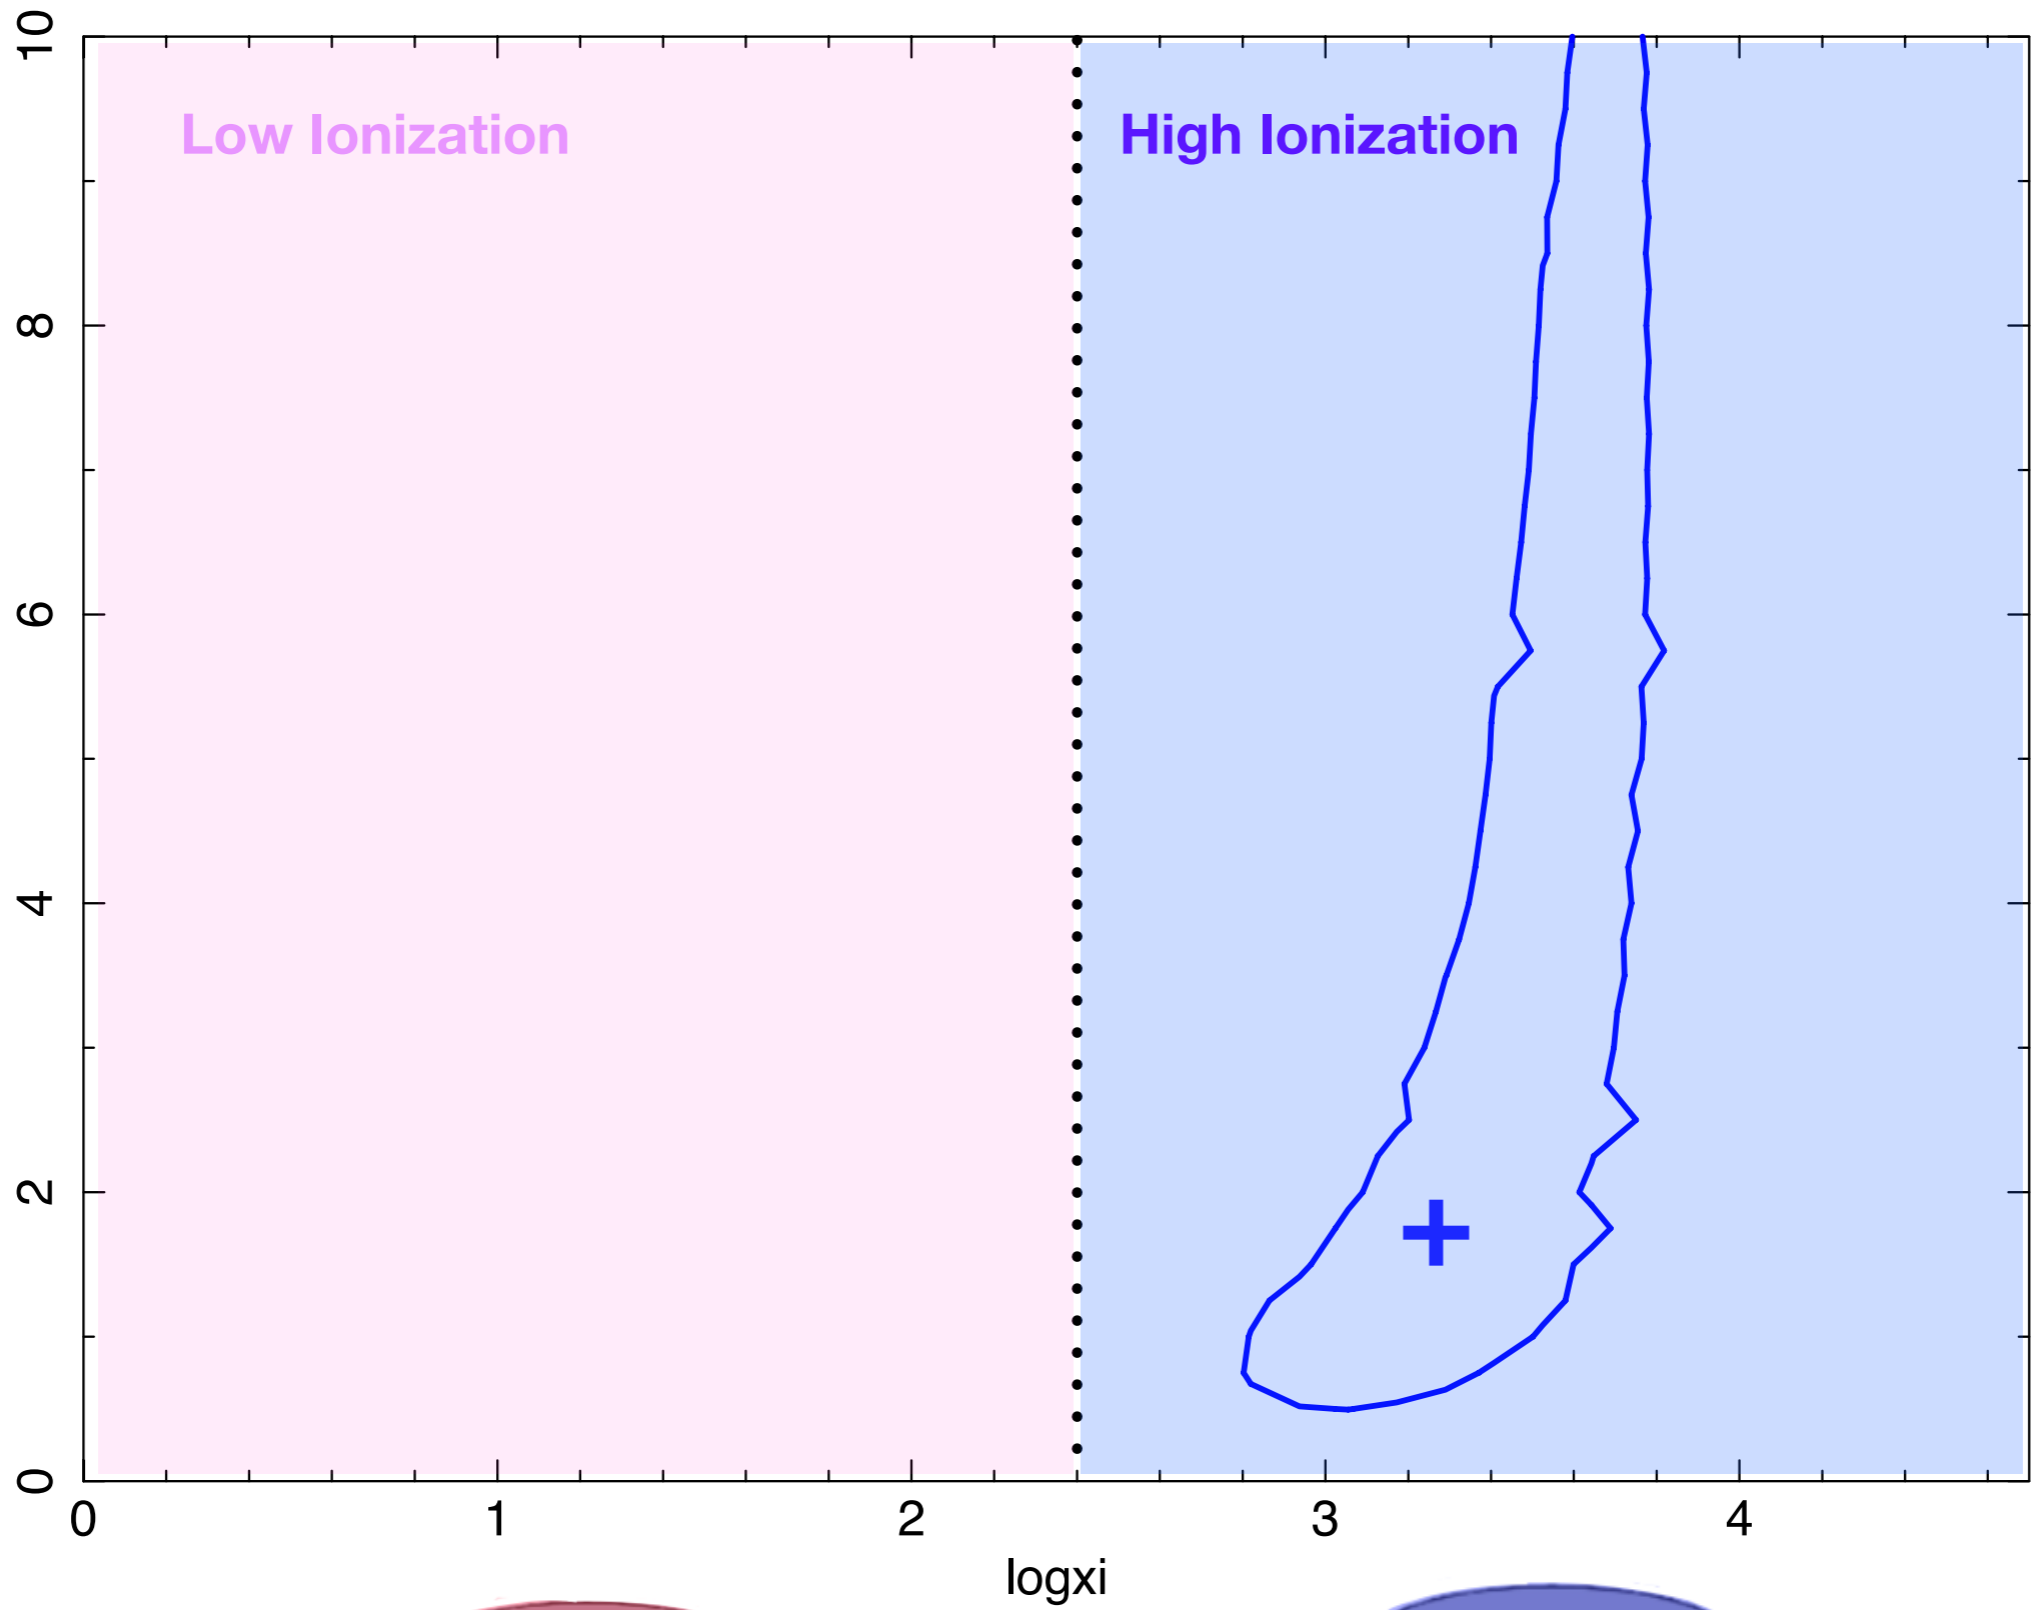

Reflection: Torus

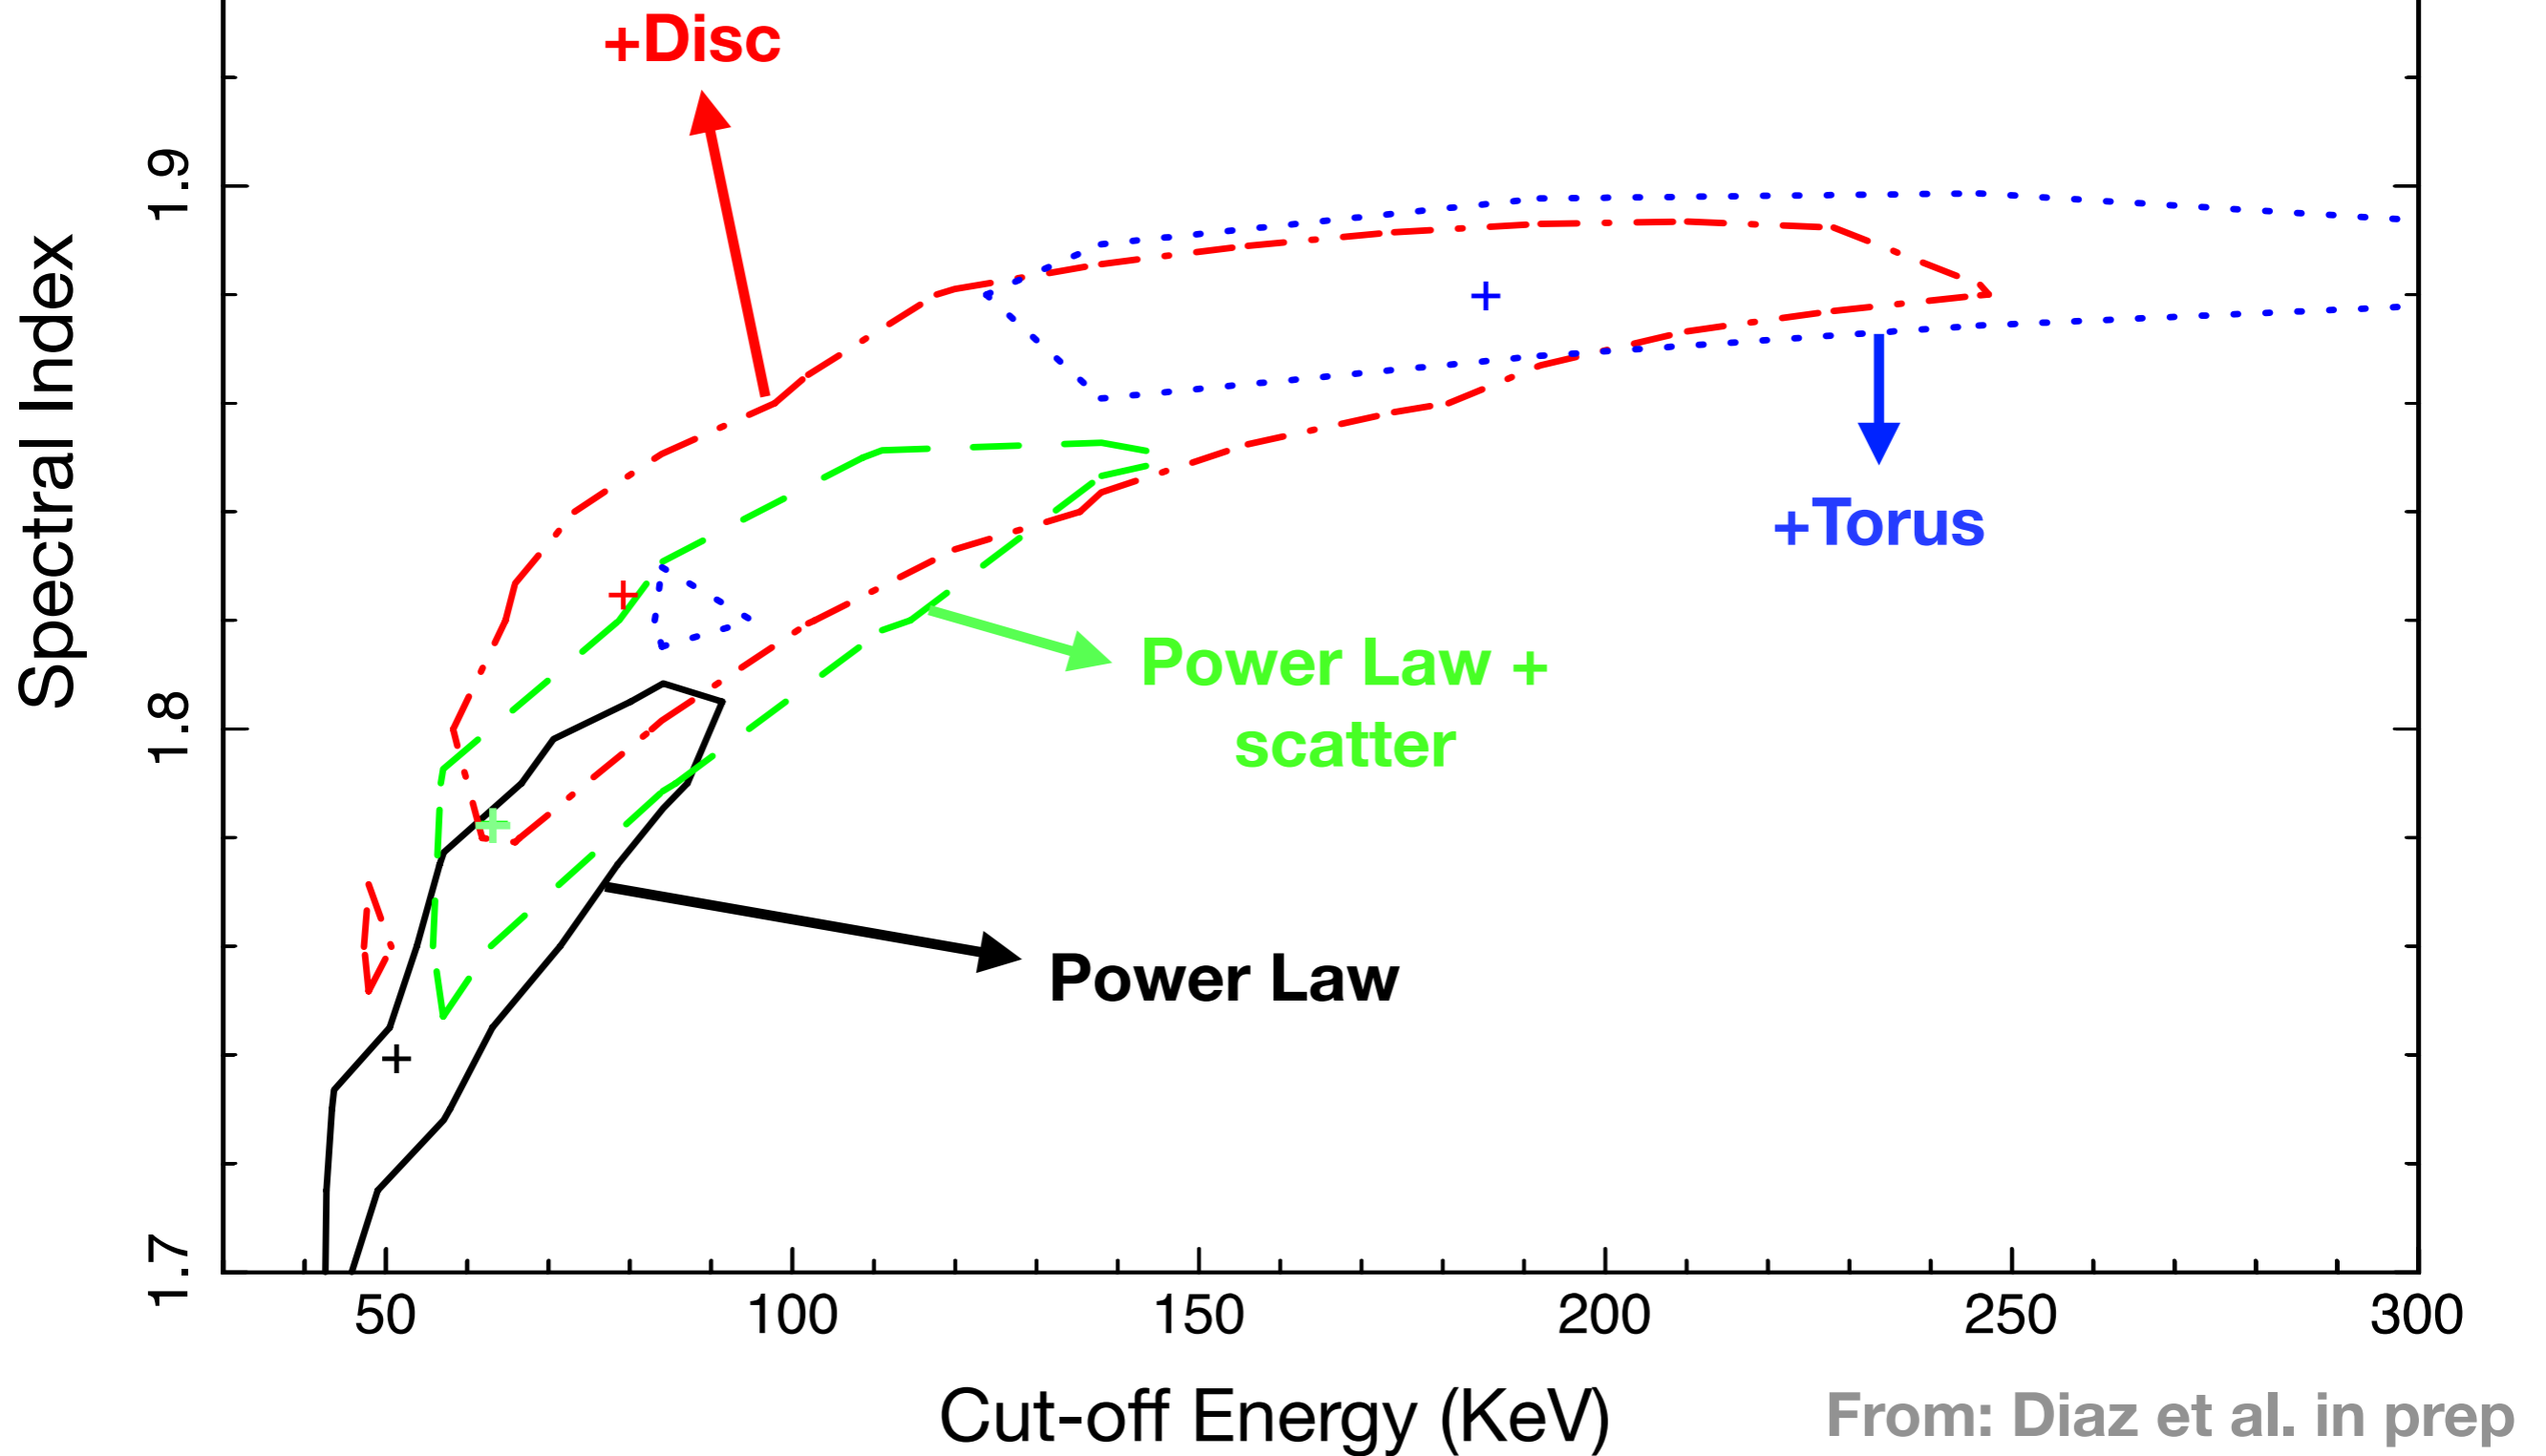

Reflection: Accretion Disk

R_f

Constraining the intrinsic coronal spectrum of NGC3718

Conclusion

- The type of reflector affects the measurement of the power-law parameters.
- The reflector in the low luminosity AGN could be a low column density torus covering a large fraction of the sky or a highly ionized accretion disk.
- The energy range of the data affect in the estimation of the photon index. Low energy data allows to adjust a simple power-law model and underestimate the parameters of the primary X ray emission.

Conclusion

- The type of reflector affects the measurement of the power-law parameters.
- The reflector in the low luminosity AGN could be a low column density torus covering a large fraction of the sky or a highly ionized accretion disc.
- The energy range of the data affect in the estimation of the photon index. Low energy data allows to adjust a simple power-law model and underestimate the parameters of the primary X ray emission.

Future work

- Study the Accretion physics → Correlation between Gamma and Accretion rate using high quality X-ray spectra and a variety of new models from Ho et al. (1997) sample.

That's all Folks!
